

DiagnoCenter

Diagnostic Center Billing ERP

Windows Installation Guide • Version 2026.05

For Windows 10 / Windows 11 PCs

What You Need

- **One main computer** (Windows PC) to act as the server — this is the only PC that needs the installer
- **Other computers** on the same Wi-Fi or LAN — no installation needed, just a web browser
- **Installer file:** `DiagnoCenter-Setup.exe` (about 320 MB)
- **Minimum specs:** Windows 10/11, 4 GB RAM, 1 GB free disk space

Tip: The main server PC should be the fastest computer in your clinic. It runs the database and the web server for everyone.

Step-by-Step Installation

1 Download the Installer

Get `DiagnoCenter-Setup.exe` from the download link provided. Save it to your Desktop or Downloads folder.

Note: The file is about 320 MB. It may take a few minutes to download depending on your internet speed.

2 Run the Installer

Double-click `DiagnoCenter-Setup.exe` . If Windows shows a "Windows protected your PC" warning:

1. Click **More info**
2. Click **Run anyway**

Follow the setup wizard:

1. Click **Next**
2. Choose install location (default is fine: `C:\Program Files\DiagnoCenter\`)
3. Click **Install**
4. Wait for installation (about 1-2 minutes)
5. Click **Finish**

3 Start the Server

Go to your Desktop and double-click the **DiagnoCenter** shortcut (or go to `C:\Program Files\DiagnoCenter\` and double-click `DiagnoCenter.exe`).

A black console window will open. **Do not close this window.** It is the server running.

Wait about 30 seconds. You will see:

```
Launcher ready
LAN ACCESS -- Other computers can reach this server at:
http://192.168.1.50:8888/
```

The IP address will be different for your clinic. Write it down.

Important: Keep this black window open all day. If you close it, the server stops and other computers cannot connect. If you accidentally close it, just double-click `DiagnoCenter.exe` again.

4 Open Firewall (One-Time Setup)

If other computers cannot connect, you need to open the Windows firewall:

1. Press `Win + R` , type `cmd` , press Enter
2. Copy and paste this exact command, then press Enter:

```
netsh advfirewall firewall add rule name="DiagnoCenter" dir=in action=allow protocol=TCP localport=8888
```

You should see `Ok.` — done.

5 Use on Other Computers

No installation needed on other PCs. Just open a web browser:

1. Open **Google Chrome** or **Microsoft Edge**
2. In the address bar, type the LAN URL from Step 3, for example:

```
http://192.168.1.50:8888/
```

(Replace with the actual IP shown on your server)

3. Press Enter
4. The login screen appears — log in with your staff PIN

Daily Routine

Task	How to Do It
Start the server in the morning	Double-click <code>DiagnoCenter.exe</code> or the Desktop shortcut
Stop the server at night	Close the black console window (or press Ctrl+C inside it)
Print reports	Works from any computer that has a printer installed
Check who is connected	Look at the console window — it shows connection requests

Useful Tips

Pin to taskbar: Right-click the DiagnoCenter shortcut → **Pin to taskbar**. Now you can start the server with one click.

Auto-start on boot: Press `Win + R`, type `shell:startup`, press Enter. Drag `DiagnoCenter.exe` into that folder. The server will start automatically every time the PC turns on.

Backup your data: The database is stored in `C:\Program Files\DiagnoCenter\data\pgsql\`. Copy the entire `data` folder to a USB drive regularly. Patient data cannot be recreated if lost.

Update without reinstalling: When a new version is available, use `DiagnoCenter-Update.zip` inside the ERP (go to **Settings → System Update**). This patches the app without losing any data.

Troubleshooting

Problem	Solution
"Windows protected your PC" when running the installer	Click More info → Run anyway . The software is not digitally signed yet.
"Cannot GET /" in the browser	The server is still starting. Wait 30 more seconds and refresh the page.
Other PC says "This site can't be reached"	Check Step 4 (firewall). Also make sure both PCs are on the same Wi-Fi network.
Forgot the LAN IP address	On the server PC, press <code>Win + R</code> , type <code>cmd</code> , type <code>ipconfig</code> , look for "IPv4 Address" under Wi-Fi or Ethernet.
App is slow on client computers	The server PC should be the fastest computer. If it is old or low on RAM, the whole clinic will feel slow.
Black console window shows errors	Take a screenshot and contact support. Common causes: port already in use (another program is using port 8888).

Security Checklist

- ☐ Change the default admin PIN after first login
- ☐ Set up regular backups (copy the `data` folder)
- ☐ Enable Windows automatic updates on the server PC
- ☐ Use a strong Windows password on the server PC
- ☐ Do not expose port 8888 to the internet without a VPN

Need Help?

Contact your software support and provide:

1. The LAN URL (e.g., `http://192.168.1.50:8888/`)
2. A screenshot of any error message
3. Whether the black console window shows "Launcher ready"
